Abstract

Crime is one of the major problems encountered in any society. Thus, there is an important need for security agents and agencies to battle and eradicate crime. Sri Lankan police is responsible for investigating and detecting criminals of any crime committed within the country. Crime is an act usually deemed socially harmful, specifically defined, prohibited and punishable under criminal law. Crime rates are rapidly increasing and changing. Crime prediction is very important in any country. In Sri Lanka, crime detection among people is very crucial to Department of police office. The purpose of Identity investigation system with suspect prediction that tracks the investigation status of criminal cases with logs and also predicts primary suspects. This project is mainly based on Android Studio and WEKA tool. This project has main two parts. In system has suspect prediction part. In this system it uses data mining techniques for prediction process. For that purpose, mainly system uses WEKA Tool. Identity investigation process is second main part of this project. It is doing by using SQL functions. It uses Short Message Service (SMS) and other functions for data security. Basically, mobile application development doing by Android Studio.

Keywords: *SMS, Alarm, Android Application, Data Mining, WEKA Tool, SQL Function*

Introduction

At the present crimes are increasing highly in Sri Lanka. In Sri Lanka, police department is the largest unit for preventing crimes, maintaining law orders, rules and peace throughout the country. However, problem with the Sri Lankan police is that they are still using the traditional manual process to keep and analyse the records of crime and criminals. On the other hand, criminals use more advance technologies to commit the crime in more tactful ways. Crime rates in Sri Lanka are increasing enormously among countries and their variations in this dimension is orders of magnitude greater their variation through the time in a given country. [1]. Over the previous few years most of the countries of the world has experienced a remarkable increase in rate. There is no explicit reason for any disorder for criminal activities. Generally, society, cultural factors, totally different family systems, political influences and enforcement are responsible for criminal activities of an individual. Crime rate is growing in Sri Lanka. Crime is also found in numerous forms. Organized crime includes drug trafficking, shooting, concealing, extortion, and murder for rent, fraud, human trafficking. [2] Several criminal activities result in political violence, religiously impelled violence, terrorism, and abduction. The opposite sort of crimes includes homicide, robbery, assault etc. Corruption may

[6] Decision trees are the most powerful mining. It includes the technology of research large and complex bulk of data in order to discover useful patterns. This idea is very important because it enables modelling and knowledge extraction from the bulk of data available.

Figure 2: Select J48 Model
(Source: Created by author)

To address third requirement of the project, the author has selected the good **proto type** for the project.

To implement this research the author has selected the **prototyping** model. The prototyping model is a systems development method in which a prototype is built, tested and then reworked as necessary until an acceptable outcome is achieved from which the complete system or product can be developed [7].

B. Analysis

In this analysis part author carries deep investigation about the algorithms. To develop a accuracy high system, author has to select good algorithm for system. Basically, the author has selected two major algorithms and comparison has done by considering the accuracy levels.

approaches in knowledge discovery and data Classification technique is used to find the common properties among different attributes of crime and criminal dataset and organizes them into different predefined classes. Classification is a data mining technique which is often used for predicting crime patterns and it also can reduce the time required to identify these crime patterns. However, classification technique requires proper training and testing data because a certain number of missing values may limit the prediction accuracy. [8] For example, we can apply classification in crime application that given all past records of criminals who commit the crime, predict which current criminals are probably to commit the crime in the future.

Firstly, author should have a set of training instances. This uses a J48 decision tree algorithm and merit selection criteria to choose the best splitting attribute to create a branch. Thus, author has two partitions. Algorithm will apply same top-down analysis to make further more partitions. One of the stopping criteria is when all the attribute's values belong to a single class. There is only difference in splitting criteria if do comparison between multi and univariate tree construction. [9]. From the experimental results, J48 algorithm predicted the unknown category of crime data to the accuracy of **94.25287%** which is fair enough for the system to be relied on for crime prediction system.

In second section, the author has tried to train data set with k-means clustering, the results of k-means clusters are verified with WEKA. WEKA verifies an accuracy of 52.62 and 52.99 % in the formation of two crime clusters using the selected crime attributes.

Error Calculation:

$$\text{Cluster 1} = \text{MOD}(2,445 - 2,289) / 2445 = 0.0638$$

of different diagrams, views of different level of abstraction and contributes from different stakeholders and modellers. These open to consistency problems between diagrams [11]. In this system the main actor is the Police office. Police officer. Police officer can insert information, prediction process to the system.

Data Flow diagram basically shows all data stores and basic operations of the system. Mainly police officer can access and handle all data stores. Above diagram shows all data flows of this system.

E. Implementation

In this project author has used main three components. Data Mining (WEKA Tool), database, Android application.

In implementation stage, basically authors have created this project according to the following process flow chart. In a software implementation, it is often easier to trade off reliability for performance because the software can be changed or adopted to specific needs. Mainly this system develops under WEKA Tool. It has been indicated through Figure 03.

F. Testing

In computer programming, unit testing is a software testing method by which individual units of source code are tested to determine whether they are fit for use. A unit is the smallest possible testable software component. Usually, it performs a single cohesive function. In this project authors mainly did test major two parts.

01) Mobile Application in Android Studio. Authors did simple testing to my mobile application and all functions are checked under it.

02) Data Mining WEKA TOOL

Results and Discussion

This content covers the results that were achieved from the research project and what were the new approaches found to address further research in the undergraduate context. This is the final outcome of this product. By using this Admin page, the users can move to prediction page

Figure 10: Prediction Page (Source: Created by authors)

Identity Investigation System with Suspect Predication searches for imminent patterns and relations in the given crime data by using the J48 techniques. In this section, the results of J48 are verified with WEKA. Here the classification result of J48 – a decision tree is shown using parameters such as correctly classified instances, true positive rate, and false positive rate [12]. This technique provides an overview of large amount of the crime data and facilitate in handling, searching and retrieving of the desired crime information. Identity Investigation System with Suspect Predication can also be useful for crime prevention

Future works and Conclusions

Implemented system presented an efficient and affordable method for real time problem solve system this system can be updated to the extraordinary level. Therefore, authors are strongly recommended this system will be solve numerous problems regarding its administration in high level.

In order to use this system research, authors have not enough data to data mining to get good prediction. Though the data for data mining is a limitation. Recommendation to those who willing to develop this system further as follows;

- Add more data and do the data mining to get good result.
- Develop the system to get more accurate result.
- Add international prediction algorithms to this system.
- Add more security features.
- Enhance number of users.
- More user-friendly interfaces.
- Add more algorithms.
- Increase accuracy.

Above changes can add more quality for this system.

As a future extension of this study, a web based criminal identification system is proposed which will give information of criminal at a single click from any place. This system will also serve the purpose of crime information sharing and investigators can access the criminal information from any place.

Declarations

Study Limitations

When developing this project, authors followed sample data mining projects. Authors achieved their target scope and authors face some difficulties when working with data sets. Here for data mining purpose authors needed very

large amount of data records and when handling that data set, authors faced some limitations. In data mining process, it is a known fact that data mining collects information about people using some market-based techniques and information technology. To run this data mining-based project authors required high performed machines. These are main identified study limitations of this project.

Acknowledgements

Author would like to take this as an opportunity to thank everyone who has helped to finish this project. Author would like to offer sincere gratitude to Mr. Dhishan Dhammearatchi for his quality service. It was very helpful for us to gain proper knowledge, to correct this mistake and finally to make a enhance project.

Another special thank is going to Project reader Mr. Rajeeva De Silva for his valuable assistance in this project.
